

Inspection & Calibration

The Inspection and calibration function allows the use of mobile to capture of detailed inspections data

The Proteus MMX Inspection/calibration function is an easy tool to create inspections of equipment within Proteus MMX. While performing inspections users enter reports of their findings using their tablets or mobile phones.

The interface is easy to use, allowing for rapid data capture checking off items from a preset inspection task along with ranges. Users can also customize their own lists of inspection questions and response types (i.e. percentages, numbers, yes/no, pass/fail).
